Localization of Lectin Receptors in Cultured Microglia

Electron micrograph showing lectin labelling of cultured microglia fixed 30 min after incubation with GSA I-B4-HRP at 4 °C. The GSA I-B4 is an isolectin derived from the seed of *Griffonia simplicifolia* and binds specifically the α -D-galactosyl residues of membranous glycoproteins or receptors of microglia. The staining for lectin receptors on both round (M1) and process-bearing (M2) microglia is localized mainly at the plasma membrane (arrowheads). X,4000.
