

妊娠期间臍尿管重開放

Reopening of Patent Urachus during Pregnancy

摘要

臍尿管(urachus)在妊娠期間重開放是非常罕見的狀況。病人在懷孕 27 週時發現有尿液從肚臍流出，而流出的量跟隨懷孕的週數而與日俱增，臨床懷疑為臍尿管重開放(patent urachus)。在病患生產後作一些 X 光的檢查，包括瘻管攝影和電腦斷層攝影均証實為臍尿管重開放。病人最後接受臍尿管切除術伴隨部份膀胱切除。

Abstract

A rare case of reopening of the patent urachus with urine leakage encountered during pregnancy is reported. Fistulography and computed tomography revealed a communicating tract between the dome of the urinary bladder and the umbilicus. The patient was treated by urachus resection and partial cystectomy.
